

The bundle

FieldTypes, like any other eZ Publish 5 extensions, must be provided as Symfony 2 bundles. This chapter will cover the creation and organization of this bundle.

First, we will explain how to generate the skeleton for a standard Symfony 2 bundle using the console: [Creating the bundle](#). Then, we will explain what structure we suggest for storing a FieldType inside a bundle: [Structuring the bundle](#).

Previous: [Introduction to "eZ Publish 5 Field Type" tutorial](#)

Next: [Implementing the Tweet\Value class](#)
