htaccess example

These rewrite rules can be used if you don't have direct access to alter the virtual host configuration, which is common in a shared hosting setup. The file ".htaccess_root" is included in the installation package of your eZ Publish installation. In order to activate these rewrite rules in your hosted environment, you must change the name of the file to ".htaccess" and keep in the same folder as the original ".htaccess_root" file.

Please find an example of the ".htaccess" rewrite rules below:

```
# Copy this file to a new file called .htaccess in your eZ Publish root
# to secure your installation by turning on .htaccess based virtual host
mode.

# Environment.
# Possible values: "prod" and "dev" out-of-the-box, other values possible
with proper configuration
# Defaults to "prod" if omitted
SetEnv ENVIRONMENT "prod"

# Whether to use Symfony's ApcClassLoader.
# Possible values: 0 or 1
# Defaults to 0 if omitted
#SetEnv USE_APC_CLASSLOADER 0

# Prefix used when USE_APC_CLASSLOADER is set to 1.
# Use a unique prefix in order to prevent cache key conflicts
# with other applications also using APC.
# Defaults to "ezpublish" if omitted
#SetEnv APC_CLASSLOADER_PREFIX "ezpublish"

# Whether to use debugging.
# Possible values: 0 or 1
# Defaults to 0 if omitted, unless ENVIRONMENT is set to: "dev"
#SetEnv USE_DEBUGGING 0

# Whether to use Symfony's HTTP Caching.
# Disable it if you are using an external reverse proxy (e.g. Varnish)
# Possible values: 0 or 1
# Defaults to 1 if omitted, unless ENVIRONMENT is set to: "dev"
#SetEnv USE_HTTP_CACHE 1

# Defines the proxies to trust.
# Separate entries by a comma
# Example: "proxy1.example.com,proxy2.example.org"
# By default, no trusted proxies are set
#SetEnv TRUSTED_PROXIES "127.0.0.1"
